**Research interest**

Synchrotron Radiation (SR) can produce very bright light at various wavelengths, usually from infrared up to X-ray. Due to this brightness and the wavelength tunability, SR can have a wide range of applications, including many research fields (e.g. physics, material science, biology, chemistry, environmental study and engineering). Realizing much use of SR techniques, our group have much interest in exploiting SR techniques available at the Thai institute (Synchrotron Light Research Institute, SLRI) and the laboratories in abroad (e.g. ALS and SSRL) to various research topics. Our current research interests are on

- 1) transition-metal oxides/ dichalcogenides
- 2) carbon-based materials
- 3) physical phenomena at low temperature
